Ajinomoto Animal Nutrition Europe

32 rue Guersant, 75017 Paris, France

<http://www.ajinomoto-animalnutrition-emea.com/>

The first edition of EvaPig®, released in 2008, was made possible by the contributions, advice, encouragement, and feedback of many people from INRAE, particularly Jean-Yves Dourmad (biological effects of endogenous and exogenous phytase), Bernard Sève (ileal standardised digestibility of amino acids), Catherine Jondreville (phosphorus digestibility), Jaap Van Milgen, Serge Dubois and Henri Flageul. The chemical data for that version were provided by the editors of the INRA-AFZ tables 2002-2004, Daniel Sauvant, Jean-Marc Perez, and Gilles Tran.

The chemical data for EvaPig® 2020 were provided by AFZ, the editor of the INRAE-CIRAD-AFZ Tables (www.feedtables.com, created in 2017). As in the previous version, the nutritional values were obtained using expertise from INRAE and equations derived from *in vivo* measurements published in the scientific literature. The data for amino acid digestibility were derived from: AFZ, Ajinomoto Eurolysine, Aventis Animal Nutrition, INRA, ITCF, 2000. *AmiPig. Standardised Ileal Digestibility of amino acids in feedstuffs for pigs*, AFZ, Paris.

In addition to INRAE and Ajinomoto Animal Nutrition Europe, the following organisations have supported the French Feed Database of the AFZ since 1989: Arvalis Institut du Végétal, CCPA, Cargill, CIRAD, Cooperl, Désialis, IFIP-Institut du Porc, MG2MIX, MixScience, Techna, Terres Univia, USICA, and Wisium. We thank in advance the people who will help to make EvaPig® better and more useful, notably by providing us with nutritional values for new ingredients, or more accurate and up to date information. If your organisation is willing to share such data, please send inquiries and suggestions through www.evapig.com.

Introduction

The purpose of this document is to provide users with a full reference of the equations and coefficients used throughout EvaPig® to calculate energy, protein, and mineral values.

This new edition of EvaPig® includes 256 reference ingredients vs. 132 in the previous one, as well as values for macro minerals and electrolyte balance. The calculation bases are unchanged compared to the previous version.

These equations are used at 4 different places in EvaPig®:

- Ingredient creation based on a reference ingredient
- Diet creation based on a list of ingredients
- Ingredient creation based on chemical composition only
- Diet creation based on chemical composition only

Calculations based on chemical composition only are similar for ingredients and diets and will be presented in the same chapter.

Units and abbreviations

Except when noted otherwise, the equations and coefficients in this document are expressed using the following units:

- MJ/kg dry matter (DM) for energy values
- % DM for the chemical composition
- % for ratios and digestibilities

The coefficients are only valid when the data are expressed in those units. If you want to use other units, such as kcal/kg for energy or g/kg for chemical values, please convert the coefficients accordingly.

Please note that many equations only work when the input data are expressed on the dry matter basis.

The following table presents the abbreviations used in this manual.

Table 1. List of abbreviations

Abbreviation	Full name
ADF	Acid detergent fibre
DE	Digestible energy
DEa	Digestible energy for adult pig
DEg	Digestible energy for growing pigs
DM	Dry matter
DP	Digestible phosphorus
Ed	Energy digestibility
Eda	Energy digestibility for adult pigs
Edg	Energy digestibility for growing pigs
EUri	Energy lost from urinary nitrogen
GE	Gross energy
ME	Metabolizable energy
MEa	Metabolizable energy for adult pigs
MEg	Metabolizable energy for growing pigs
MJ	Megajoules
Nd	Faecal nitrogen digestibility
NDF	Neutral detergent fibre
NE	Net energy
NEa	Net energy for adult pigs
NEg	Net energy for growing pigs
NUri	Nitrogen lost in urine
OMd	<i>In vivo</i> organic matter digestibility
OMdg	<i>In vivo</i> organic matter digestibility for growing pigs
OMdv	<i>In vitro</i> organic matter digestibility
Pd	Phosphorus digestibility
Res	Residue = 100 – Ash – Protein – Fat – Starch – Sugars
ResD	Digestible residue

Validation checks

Several checks are used to ensure that the data are valid and consistent with each other.

- The sum of nutrients in a diet or an ingredient should not be higher than 105% with NDF as the fibrous fraction indicator. When the NDF analysis is absent, it is estimated as 2.5 x ADF (if present) or 3 x crude fibre (if no other fibre analysis is present).
- The sum of amino acids should not be higher than 110% of crude protein.

Calculations

EvaPig® uses equations to calculate the nutritional values of new ingredients and diets. These equations were obtained through INRA experiments or derived from literature data.

The main benefit of using equations is that the predicted values are more precise than fixed values. However, this precision depends on many factors, not all of which are known, and users should always exercise caution when using predicted values.

Ingredient creation based on a reference ingredient

General principles

Creating a new ingredient using a reference ingredient is the recommended method. The calculations combine the values of the reference ingredient with coefficients that are applied to the differences in chemical composition between the new ingredient and the reference ingredient. Some equations have generic coefficients while others have ingredient-specific ones.

The formula is of the general form:

$$Y_{\text{New}} = Y_{\text{Ref}} + a \times (X_{\text{New}} - X_{\text{Ref}}) + b \times (Z_{\text{New}} - Z_{\text{Ref}}) + \dots$$

where Y is the predicted value and X, Z etc. are the predictors. "New" refers to the new ingredient and "Ref" refers to the reference ingredient.

Energy values

Calculation outline

The calculation of energy values involves the following steps:

- $GE = f(\text{protein, fat, ash})$
- $Ed = f(\text{fibre})$
- $DE = GE \times Ed$

- $DE_a = f(DE_g, Ed_g, ash)$
- $ME/DE = f(\text{protein}, DE)$
- $ME = DE \times ME/DE$
- $NE/ME = f(\text{protein}, \text{fat}, \text{starch}, ME)$
- $NE = ME \times NE/ME$

Gross energy

Gross energy (GE) is calculated from the reference ingredient using the following coefficients:

$$GE_{New} = GE_{Ref} + 0.0616 \times (\text{Protein}_{New} - \text{Protein}_{Ref}) + 0.2192 \times (\text{Fat}_{New} - \text{Fat}_{Ref}) - 0.1866 \times (\text{Ash}_{New} - \text{Ash}_{Ref})$$

Energy digestibility (Ed) and digestible energy (DE)

Energy digestibility (Ed) for growing pigs is calculated from the reference ingredient with ingredient-specific equations that use fibre as a predictor.

The fibre value can be either crude fibre, NDF or ADF, with different values for the coefficient.

$$Ed_{New} = Ed_{Ref} + a \times (\text{Fibre}_{New} - \text{Fibre}_{Ref})$$

where a is the ingredient-specific coefficient for either crude fibre, NDF and ADF.

The coefficients for fibre are provided in Table 5 at the end of this document.

However, as the user may use new values for crude fibre, NDF and ADF, the final value is calculated as the average of the calculated values for the available (new) fibre data. For instance, if the user provides new values for both NDF and ADF, the calculation will be:

$$Ed_{NewNDF} = Ed_{Ref} + a_{NDF} \times (\text{NDF}_{New} - \text{NDF}_{Ref})$$

$$Ed_{NewADF} = Ed_{Ref} + a_{ADF} \times (\text{ADF}_{New} - \text{ADF}_{Ref})$$

$$Ed_{New} = (Ed_{NewNDF} + Ed_{NewADF}) / 2$$

a_{NDF} and a_{ADF} are the coefficients for the NDF and ADF-based equations respectively.

The energy bonus is added to the energy digestibility coefficient:

$$Ed_{New} = Ed_{New} \times (100 + \text{Bonus}) / 100$$

Digestible energy is calculated as follows:

$$DE_{New} = Ed_{New} \times GE_{New} / 100$$

Metabolizable / digestible energy ratio

The ME/DE ratio for growing and adult pigs is calculated using a generic coefficient for protein.

$$ME/DE_{New} = ME/DE_{Ref} - 1.98 \times (\text{Protein}_{New} - \text{Protein}_{Ref}) / DE_{New}$$

The reference ME/DE ratios are provided in Energy ratios

Table 6 at the end of this document.

Net energy / metabolizable energy

The NE/ME ratio for growing and adult pigs is calculated using generic coefficients:

$$NE/ME_{New} = NE/ME_{Ref} + ((5.5 \times (Fat_{New} - Fat_{Ref}) + 1.5 \times (Starch_{New} - Starch_{Ref}) - 2.8 \times (Protein_{New} - Protein_{Ref})) / ME_{New}$$

The reference NE/ME ratios are provided in Energy ratios

Table 6 at the end of this document.

Digestible energy for adult pigs

The digestible energy for adult pigs (DEa) is calculated from the digestible energy for growing pigs (DEg) using ingredient-specific coefficients.

$$DEa_{New} = DEg_{New} + a_{Ref} \times (1 - Ash_{New} / 100) \times (1 - b_{Ref} \times Edg_{New} / 100)$$

If no ash value is provided for the new ingredient, the ash value of the reference is used instead.

$$DEa_{New} = DEg_{New} + a_{Ref} \times (1 - Ash_{Ref} / 100) \times (1 - b_{Ref} \times Edg_{New} / 100)$$

The a and b coefficients for the equations above are provided in Energy ratios

Table 6 at the end of this document.

Faecal nitrogen digestibility

Faecal nitrogen digestibility (Nd) for a new ingredient is calculated from the reference ingredient using generic coefficients for protein and fibre. Those coefficients differ for growing and adult pigs.

$$Nd_{New} = Nd_{Ref} + a \times (Protein_{New} - Protein_{Ref}) + b \times (Fibre_{New} - Fibre_{Ref})$$

The a and b coefficients are shown in the table below.

Table 2. Fibre and protein coefficients for the prediction of nitrogen digestibility

Type of pig	Type of fibre	a (protein)	b (fibre)
	CF	0.69	-1.21
Growing	NDF	0.79	-0.69
	ADF	0.70	-1.16

Type of pig	Type of fibre	a (protein)	b (fibre)
	CF	0.77	-0.87
Adult	NDF	0.86	-0.44
	ADF	0.78	-0.83

Electrolyte balance

The electrolyte balance (EB) is calculated from the values of sodium (Na), potassium (K), and chlorine (Cl). EB is expressed in mEq/kg DM and the minerals are expressed in % DM.

$$EB = 1000 \times (10 \times Na / 23 + 10 \times K / 39 - 10 \times Cl / 35.5)$$

Note: Electrolyte balance is not recalculated when values of Na, K, and Cl are changed.

Diets created from a list of ingredients

General principles

Diets are usually created in EvaPig® using a list of ingredients. The chemical and nutritional values are calculated as the weighed contributions of the ingredients, taking into account their incorporation rates and dry matter values.

For that reason, when a nutrient is missing from an ingredient, it will not be part of the diet calculations. For instance, if an ingredient does not have a net energy value attached, net energy will not be calculated for any diet including this ingredient.

Digestible phosphorus

The digestibility of the phosphorus provided by the ingredients may be reduced by processing, which decreases the activity of endogenous phytase, and it may be increased by addition of exogenous phytase. To calculate the digestible phosphorus content of a diet, it is necessary to know:

- The phosphorus content of the individual ingredient
- The phosphorus digestibility of those ingredients, both in mash (unprocessed) and pellet (processed) forms
- The physical form of the diet (mash or pellet)
- The amount and concentration of exogenous phytase added to the diet that will release part of the phytic phosphorus
- The quality of the phytase, expressed as the amount of digestible phosphorus released per 500 IU of phytase.

When no phytase is added, the calculation is straightforward, and consists in summing the contributions of each ingredient, taking into account the incorporation rate and whether or not the

diet is processed: for an unprocessed diet, the values will be those of the mash ingredients while for a processed diet, the values will be those of the pelleted ingredients.

When phytase is added, the calculation adds its contribution to phosphorus release. The relationship between the level of phytase and the amount of released phosphorus is curvilinear:

Equation #1

$$\text{Released P} = 1.026 \times (1 - e^{(-0.00263 \times \text{Phytase units} \times c)})$$

For a known quantity of released P, the number of phytase units necessary can be calculated as follows:

Equation #2

$$\text{Phytase units} = -\text{Ln}(1 - P_{\text{released}}/1.026) / (-0.00263 \times c)$$

P is expressed in g and the phytase units in IU.

The coefficient c depends on the activity of the phytase used, expressed in g of released P per 500 IU of phytase.

Table 3. Coefficients for the prediction of phytase units

Phytase activity	c
0.60	0.668
0.65	0.763
0.70	0.872
0.75	0.999
0.80	1.151
0.85	1.340
0.90	1.595

The calculation of the digestible phosphorus in the diet goes as follows:

First, digestible P is calculated using the values of the ingredients. This calculation will use the mash or pellet ingredient values depending on the diet form.

If the diet is in pellet form, the ingredients do not contribute to phosphorus release (endogenous phytase is deactivated) and release of phytic P is entirely due to the added phytase. The released P is calculated using Equation #1 and added to the digestible P.

If the diet is in mash form, the ingredients contribute to phosphorus release, so the released P is due to endogenous and exogenous sources of phytase.

1. The difference between the digestible phosphorus values for mashed and pelleted ingredients is used in Equation #2 to calculate the amount of endogenous phytase:

$$\text{Phytase}_{\text{Endo}} = f(\text{dP}_{\text{Mash}} - \text{dP}_{\text{Pellet}}) \text{ where } f \text{ is Equation \#2}$$

2. The total amount of phytase is calculated by adding the (known) quantity of exogenous phytase to the quantity of endogenous phytase calculated previously:

$$\text{Phytase}_{\text{Total}} = \text{Phytase}_{\text{Exo}} + \text{Phytase}_{\text{Endo}}$$

3. This value is used in Equation #1 to calculate the total amount of phosphorus released by both endogenous and exogenous phytase:

$$\text{P}_{\text{ReleasedTotal}} = f(\text{Phytase}_{\text{Total}}) \text{ where } f \text{ is Equation \#1}$$

4. The amount of P released by exogenous phytase is calculated as the difference between the total amount of released P calculated in the previous step minus the amount of P released by endogenous phytase:

$$\text{P}_{\text{ReleasedExo}} = \text{P}_{\text{ReleasedTotal}} - \text{P}_{\text{ReleasedEndo}}$$

5. The total digestible phosphorus is then calculated as the sum of digestible phosphorus from the mashed ingredient and the phosphorus released by exogenous phytase:

$$\text{dP}_{\text{Total}} = \text{dP}_{\text{Mash}} + \text{P}_{\text{ReleasedExo}}$$

Ingredients and diets created using chemical composition

New ingredients and diets can be created using only their chemical composition. In this case, all the calculations are based on generic equations.

This method of calculation is less precise and does not take into account ingredient-specific effects such as anti-nutritional factors or the structure of cell walls. Therefore, it should be used only when it is not possible to base the calculations on known ingredient values.

Energy values

Calculation outline

The calculation of energy values involves the following steps. Some predictors are optional.

- $\text{GE} = f(\text{protein, fat, ash, fibre, sugars, starch})$; GE value can also be provided and it will be used instead of GE calculated from chemical characteristics.
- $\text{Ingredient Ed} = f(\text{fibre})$; ash should not be used
- $\text{Diet Ed} = f(\text{fibre, ash, in vitro digestible organic matter})$
- $\text{DE} = \text{GE} \times \text{Ed}$

- $DE_a = f(DE_g, Ed_g, \text{ash}, \text{protein})$
- Energy lost from urine = $f(\text{protein})$
- Energy lost as methane = $f(\text{ash}, \text{protein}, \text{fat}, \text{starch}, \text{sugars})$
- $ME = f(DE, \text{Energy urine}, \text{Energy methane})$
- $NE = f(DE, \text{protein}, \text{fat}, \text{starch}, \text{fibre})$

Unlike the calculations used for ingredients, these equations use only generic coefficients.

Gross energy

EvaPig® uses several equations to predict gross energy. The equation used depends on the available chemical values.

Equations requiring fibre and sugars

$$GE = 17.56 + 0.0551 \times \text{Protein} + 0.2148 \times \text{Fat} + 0.0259 \times \text{Crude fibre} - 0.1774 \times \text{Ash} - 0.0114 \times \text{Sugars}$$

$$GE = 17.56 + 0.0545 \times \text{Protein} + 0.2150 \times \text{Fat} + 0.0216 \times \text{ADF} - 0.1769 \times \text{Ash} - 0.0115 \times \text{Sugars}$$

$$GE = 17.41 + 0.0579 \times \text{Protein} + 0.2163 \times \text{Fat} - 0.1812 \times \text{Ash} + 0.0148 \times \text{NDF} - 0.0072 \times \text{Sugars}$$

When more than one type of fibre is available, the final GE value is the average of all the predicted values.

Equations requiring fibre but not sugars

$$GE = 17.57 + 0.0535 \times \text{Protein} + 0.2168 \times \text{Fat} + 0.0284 \times \text{Crude fibre} - 0.1861 \times \text{Ash}$$

$$GE = 17.58 + 0.0529 \times \text{Protein} + 0.2171 \times \text{Fat} + 0.0238 \times \text{ADF} - 0.1858 \times \text{Ash}$$

$$GE = 17.40 + 0.0573 \times \text{Protein} + 0.2176 \times \text{Fat} + 0.0161 \times \text{NDF} - 0.1873 \times \text{Ash}$$

When more than one type of fibre is available, the final GE value is the average of all the predicted values.

Equation without fibre

$$GE = 18.88 + 0.0424 \times \text{Protein} + 0.2025 \times \text{Fat} - 0.2037 \times \text{Ash} - 0.0142 \times \text{Starch} - 0.0238 \times \text{Sugars}$$

Equation without fibre and sugars

$$GE = 18.47 + 0.0414 \times \text{Protein} + 0.2108 \times \text{Fat} - 0.1964 \times \text{Ash} - 0.0092 \times \text{Starch}$$

Equation without fibre and starch

$$GE = 17.61 + 0.0505 \times \text{Protein} + 0.2153 \times \text{Fat} - 0.1506 \times \text{Ash} - 0.0148 \times \text{Sugars}$$

Equation without fibre, sugars, and starch

$$GE = 17.64 + 0.0478 \times \text{Protein} + 0.2180 \times \text{Fat} - 0.1588 \times \text{Ash}$$

Energy digestibility

The prediction of energy digestibility in growing pigs requires at least a fibre value.

For ingredients and diets

$$\text{Edg} = 90.1 - 1.57 \times \text{Crude fibre}$$

$$\text{Edg} = 98.3 - 0.90 \times \text{NDF}$$

$$\text{Edg} = 90.8 - 1.43 \times \text{ADF}$$

When more than one type of fibre is available, the final Ed value is the average of all the predicted values.

For diets only

For diets created using chemical composition, it is also possible to use ash and *in vitro* organic matter digestibility (OMdv, %); Noblet and Jaguelin-Peyraud, 2007) as predictors.

Equations with fibre and ash

$$\text{Edg} = 98.0 - 1.60 \times \text{Ash} - 1.26 \times \text{Crude fibre}$$

$$\text{Edg} = 102.6 - 1.06 \times \text{Ash} - 0.79 \times \text{NDF}$$

$$\text{Edg} = 97.9 - 1.46 \times \text{Ash} - 1.17 \times \text{ADF}$$

Equations with OMdv (%), fibre and ash

$$\text{Edg} = 35.5 + 0.64 \times \text{OMdv} - 0.68 \times \text{Crude fibre} - 0.68 \times \text{Ash}$$

$$\text{Edg} = 41.0 + 0.58 \times \text{OMdv} - 0.74 \times \text{ADF} - 0.64 \times \text{Ash}$$

Equations with OMdv and fibre

$$\text{Edg} = 30.1 + 0.66 \times \text{OMdv} - 0.77 \times \text{Crude fibre}$$

$$\text{Edg} = 36.2 + 0.60 \times \text{OMdv} - 0.82 \times \text{ADF}$$

Equations with OMdv only

$$\text{Edg} = 0.976 \times \text{OMdv}$$

Adult pigs

Digestible energy for adult pigs is calculated from that of the growing pigs corrected for *in vivo* organic matter digestibility (OMd, %):

$$\text{OMd} = (7.45 + 0.949 \times \text{Edg} - 4.0 \times \text{Protein})$$

$$\text{DEa} = \text{DEg} + 4.2 \times (1 - \text{Ash} / 100) \times (1 - \text{OMd} / 100)$$

Metabolizable energy

Metabolizable energy is calculated from the digestible energy using estimates for the energy lost in methane gas and in urine. The calculation involves the following steps.

Nitrogen lost in urine (40% of N in feed)

$$\text{NUri} = 0.4 \times \text{Protein} / 6.25$$

Energy lost from urinary nitrogen (MJ and g per kg DM)

$$\text{Growing pigs: } \text{EUri} = 0.19 + 0.031 \times \text{NUri}$$

$$\text{Adult pigs: } \text{EUri} = 0.22 + 0.031 \times \text{NUri}$$

Residue

$$\text{Res} = 100 - \text{Ash} - \text{Protein} - \text{Fat} - \text{Starch} - \text{Sugars}$$

When the sugars content is missing, a default value of 2% DM is used.

Digestible residue

$$\text{Growing pigs: } \text{ResD} = 0.5 \times \text{Res}$$

$$\text{Adult pigs: } \text{ResD} = 0.6 \times \text{Res}$$

Energy lost as methane

$$\text{Growing pigs: } \text{ECH4} = 6.7 \times \text{ResD}$$

$$\text{Adult pigs: } \text{ECH4} = 13.4 \times \text{ResD}$$

Metabolizable energy

$$\text{Growing pigs: } \text{MEg} = \text{DEg} - \text{EUri} - \text{ECH4}$$

$$\text{Adult pigs: } \text{MEa} = \text{DEa} - \text{EUri} - \text{ECH4}$$

Net energy

Net energy is calculated using digestible energy, protein, fat, starch, and a fibre value. The equation is the same for growing pigs and adult pigs but DE values differ between both stages (DEg and DEa).

$$NE = 0.703 \times DE - 0.0404 \times \text{Protein} + 0.0662 \times \text{Fat} + 0.0197 \times \text{Starch} - 0.0409 \times \text{Crude fibre}$$

$$NE = 0.703 \times DE + 0.0410 \times \text{Protein} + 0.0664 \times \text{Fat} + 0.0197 \times \text{Starch} - 0.0134 \times \text{NDF}$$

$$NE = 0.700 \times DE - 0.0382 \times \text{Protein} + 0.0674 \times \text{Fat} + 0.0202 \times \text{Starch} - 0.0365 \times \text{ADF}$$

When more than one type of fibre is available, the final NE value is the average of all the predicted values.

Faecal nitrogen digestibility

Faecal nitrogen digestibility (Nd) for a new ingredient or diet is calculated using generic coefficients for protein and fibre that differ for growing and adult pigs.

Growing pigs

$$Nd = 76.8 + 0.69 \times \text{Protein} - 1.22 \times \text{Crude fibre}$$

$$Nd = 81.3 + 0.79 \times \text{Protein} - 0.69 \times \text{NDF}$$

$$Nd = 77.4 + 0.70 \times \text{Protein} - 1.16 \times \text{ADF}$$

Adult pigs

$$Nd = 77.9 + 0.77 \times \text{Protein} - 0.87 \times \text{Crude fibre}$$

$$Nd = 79.9 + 0.86 \times \text{Protein} - 0.44 \times \text{NDF}$$

$$Nd = 78.3 + 0.78 \times \text{Protein} - 0.83 \times \text{ADF}$$

When more than one type of fibre is available, the final Nd value is the average of all the predicted values.

Default values for standardised ileal amino acid digestibilities

When an ingredient is created from the chemical composition, the following default values are given for standardised ileal amino acid digestibilities.

Table 4. Default values for standardised ileal amino acid digestibility

Amino acid	Digestibility
Lys	77.0
Thr	76.0
Met	84.6
Cys	73.3
Met+Cys	78.8
Trp	77.2
Ile	80.7
Val	77.7
Leu	83.3
Phe	84.2
Tyr	85.5
Phe+Tyr	84.7
His	84.1
Arg	88.7
Ala	77.3
Asp	79.1
Glu	86.1
Gly	71.8
Ser	80.7
Pro	78.7

Default values for phosphorus digestibility

When an ingredient is created from the chemical composition, the default value for phosphorus digestibility (mash and pellet) is 20%.

Ingredient-specific coefficients and ratios

The tables below present the coefficients and ratios used for the prediction of the energy values of ingredients based on reference ingredients.

Fibre coefficients for predicting energy digestibility

Table 5. Fibre coefficients for the prediction of energy digestibility (dEg; % change of dEg per 1 % change in fibre content)

Name	Crude fibre	NDF	ADF
Alfalfa protein concentrate	-1.57	-0.90	-1.43
Alfalfa, dehydrated, protein < 16% dry matter	-1.57	-0.90	-1.43
Alfalfa, dehydrated, protein > 25% dry matter	-1.57	-0.90	-1.43
Alfalfa, dehydrated, protein 16-18% dry matter	-1.57	-0.90	-1.43
Alfalfa, dehydrated, protein 17-19% dry matter	-1.57	-0.90	-1.43

Soybean protein concentrate, protein 70-90%	-1.01	-0.71	-1.43
Soybean, full fat, extruded	-1.57	-0.90	-1.43
Soybean, full fat, flaked	-1.57	-0.90	-1.43
Soybean, full fat, toasted	-1.57	-0.90	-1.43
Soybean, full fat, toasted, flaked and expanded	-1.57	-0.90	-1.43
Sunflower hulls	-1.57	-0.90	-1.43
Sunflower meal, oil < 5%, dehulled	-1.27	-1.04	-1.32

Name	Crude fibre	NDF	ADF
Sunflower meal, oil < 5%, non dehulled	-1.27	-1.04	-1.32
Sunflower meal, oil > 5 %, protein > 30%	-1.27	-1.04	-1.32
Sunflower meal, oil > 5%, protein < 30%	-1.27	-1.04	-1.32
Sunflower seed, full fat	-1.57	-0.90	-1.43
Sweet potato, dried	-1.57	-0.90	-1.43
Tomato pulp, dehydrated	-1.57	-0.90	-1.43
Triticale	-3.33	-0.90	-1.43
Vinasse, different origins	-1.57	-0.90	-1.43
Vinasse, from the production of glutamic acid	-1.57	-0.90	-1.43
Vinasse, from yeast production, protein 30 %	-1.57	-0.90	-1.43
Vinasse, from yeast production, protein 40%	-1.57	-0.90	-1.43
Vinasse, from yeast production, protein 48%	-1.57	-0.90	-1.43
Wheat bran	-3.90	-0.92	-1.43
Wheat bran from starch production	-3.90	-0.92	-1.43
Wheat bran, durum	-3.90	-0.92	-1.43
Wheat distillers' grains, dark colour, L < 50	-3.90	-0.92	-1.43
Wheat distillers' grains, light colour, L > 50	-3.90	-0.92	-1.43
Wheat distillers' grains, starch < 7%, dried	-3.90	-0.92	-1.43
Wheat distillers' grains, starch > 7%, dried	-3.90	-0.92	-1.43
Wheat feed flour	-3.90	-0.92	-1.43
Wheat feed flour, durum	-3.90	-0.92	-1.43
Wheat feed flour, durum, from semolina	-3.90	-0.92	-1.43
Wheat gluten	-3.90	-0.92	-1.43
Wheat gluten feed, type 20% starch	-3.90	-0.92	-1.43
Wheat gluten feed, type 30% starch	-3.90	-0.92	-1.43
Wheat middlings, all types except durum	-3.90	-0.92	-1.43
Wheat middlings, durum	-3.90	-0.92	-1.43
Wheat middlings, starch < 20%	-3.90	-0.92	-1.43
Wheat middlings, starch > 40%	-3.90	-0.92	-1.43
Wheat middlings, starch 20-30%	-3.90	-0.92	-1.43
Wheat middlings, starch 30-40%	-3.90	-0.92	-1.43
Wheat straw	-1.57	-0.90	-1.43
Wheat, durum	-3.94	-0.90	-1.43
Wheat, soft	-3.94	-0.90	-1.43

Energy ratios

Table 6. Energy ratios (%) and coefficients for converting DE in growing pig to DE in adult pig (see calculations at the bottom of the table)

Name	Growing		Adult		DEa/DEg	DEg → DEa	
	ME/DE	NE/ME	ME/DE	NE/ME		a	b
Alfalfa protein concentrate	91.4	64.3	90.7	65.1	103.1	3.0	1.03
Alfalfa, dehydrated, protein < 16% dry matter	93.3	54.9	90.6	55.9	108.9	1.5	1.13
Alfalfa, dehydrated, protein > 25% dry matter	92.7	58.2	90.8	58.6	106.7	1.5	1.10
Alfalfa, dehydrated, protein 16-18% dry matter	93.3	55.2	90.7	56.0	108.7	1.5	1.13
Alfalfa, dehydrated, protein 17-19% dry matter	93.2	55.6	90.7	56.5	108.3	1.5	1.13
Alfalfa, dehydrated, protein 19-22% dry matter	93.1	57.1	90.7	58.1	107.4	1.5	1.11
Alfalfa, dehydrated, protein 22-25% dry matter	93.0	58.3	90.9	59.2	106.7	1.5	1.11
Apple pomace, dehydrated	94.7	61.8	92.2	63.2	113.2	3.0	1.09
Bakery byproducts	97.2	76.5	96.7	77.1	100.7	3.0	1.02
Bananas, dehydrated	97.7	79.8	97.0	79.9	101.2	3.0	1.03
Barley	96.8	76.6	96.1	76.7	102.8	2.5	1.04
Barley distillers grains, dried	92.9	64.2	91.3	65.8	105.8	2.5	1.04
Barley distillers grains, fresh, whisky production	92.8	64.3	90.8	65.4	111.8	2.5	1.09
Barley rootlets, dried	93.4	66.7	92.3	66.6	107.7	2.5	1.06
Beet pulp, dried	94.3	60.6	91.3	63.7	113.5	7.0	1.05
Beet pulp, pressed	94.1	59.8	90.9	63.1	115.0	7.0	1.05
Biscuit by-products	97.6	76.9	97.1	77.6	100.8	3.0	1.02
Black soldier fly larvae, dehydrated, fat < 20 %	91.4	64.6	91.1	64.1	100.0	0.0	1.03
Black soldier fly larvae, dehydrated, fat > 20 %	94.6	76.6	94.2	76.4	100.0	0.0	1.03
Blood meal	114.9	57.1	89.4	57.5	128.4	0.0	0.99
Brewers' dried grains	92.6	67.8	91.3	67.7	109.1	2.5	1.06
Brewers' yeast, dried	91.9	64.4	90.8	65.6	102.3	3.0	1.01
Buckwheat hulls	92.5	47.4	89.4	48.0	122.4	2.0	1.19
Camelina oil meal, oil > 5%	93.3	68.3	92.4	68.7	104.7	3.5	1.02
Canola meal, oil < 5%	92.2	62.8	91.3	63.3	105.7	3.5	1.03
Carob pod meal	96.7	70.9	96.0	69.2	111.4	2.0	1.10
Cassava, starch 66-70%	98.4	80.3	98.0	80.1	102.1	3.0	1.00
Cassava, starch 70-74%	98.4	80.9	98.0	80.7	101.3	3.0	1.01
Cereal offal, crude fibre > 14%	95.5	81.4	94.9	74.8	126.6	3.0	1.15
Cereal offal, crude fibre 5-14%	96.3	77.6	95.5	75.2	112.5	3.0	1.08
Chickpea, Kabuli type	96.1	75.0	95.5	75.1	103.9	6.0	1.02
Canola meal, oil < 5%	92.2	62.8	91.3	63.3	105.7	3.5	1.03

- a (kJ/g): $DEa - DEg \text{ (MJ/kg)} = (a / 1000) \times \text{Non digestible organic matter (g)}$
- b (unitless): $OMdg = b \times Edg$
